Config

Safe Haskell	None
Language	Haskell2010
Extensions	OverloadedStrings TypeSynonymInstances FlexibleInstances

Config defines the global configuration to be passed to all components.

Documentation

type **Config** = Map String Int

A Config is just a synonym for a Map String Int

get :: String -> Config -> Int

get simply wraps Data.Map.lookup with the default of 0.

insert :: String -> Int -> Config -> Config

insert wraps Data.Map.insert.

fromKVList :: [(String, Int)] -> Config

fromKVList wraps Data.Map.fromList.

confFor :: String -> Reader Config Int

confFor is a convenience method for asking for the given Config key in a Reader.
